

SYBASE®

Installation Guide

---

**PowerBuilder® 12.0**

DOCUMENT ID: DC37771-01-1200-01

LAST REVISED: April 2010

Copyright © 2010 by Sybase, Inc. All rights reserved.

This publication pertains to Sybase software and to any subsequent release until otherwise indicated in new editions or technical notes. Information in this document is subject to change without notice. The software described herein is furnished under a license agreement, and it may be used or copied only in accordance with the terms of that agreement.

To order additional documents, U.S. and Canadian customers should call Customer Fulfillment at (800) 685-8225, fax (617) 229-9845.

Customers in other countries with a U.S. license agreement may contact Customer Fulfillment via the above fax number. All other international customers should contact their Sybase subsidiary or local distributor. Upgrades are provided only at regularly scheduled software release dates. No part of this publication may be reproduced, transmitted, or translated in any form or by any means, electronic, mechanical, manual, optical, or otherwise, without the prior written permission of Sybase, Inc.

Sybase trademarks can be viewed at the Sybase trademarks page at <http://www.sybase.com/detail?id=1011207>. Sybase and the marks listed are trademarks of Sybase, Inc. A ® indicates registration in the United States of America.

Java and all Java-based marks are trademarks or registered trademarks of Sun Microsystems, Inc. in the U.S. and other countries.

Unicode and the Unicode Logo are registered trademarks of Unicode, Inc.

All other company and product names used herein may be trademarks or registered trademarks of the respective companies with which they are associated.

Use, duplication, or disclosure by the government is subject to the restrictions set forth in subparagraph (c)(1)(ii) of DFARS 52.227-7013 for the DOD and as set forth in FAR 52.227-19(a)-(d) for civilian agencies.

# Installation Workflow

This workflow defines a path for planning and installing PowerBuilder®.

## Installing the product

1. *Planning Your Installation* on page 3
2. *Preinstallation Tasks* on page 11
3. Choose one of these install methods:
  - *Installing with the Common Setup Program* on page 13
  - *Installing in Silent (Unattended) Mode* on page 29
4. *Postinstallation Tasks* on page 33

## Uninstalling

*Uninstalling a PowerBuilder Product* on page 37

# Planning Your Installation

Before you install or upgrade, prepare your environment.

- Identify the components and options to install or upgrade.
- Make sure your system meets installation requirements.
- Obtain a license.
- Identify software required.

## Installation Media Contents

---

This topic describes the contents of the PowerBuilder installation kit.

**Table 1. Installation Media Contents**

CD or DVD	Contents
The PowerBuilder installation media includes the CDs or DVDs listed in this table. The setup program on the DVD requires you to supply a license, as described in <i>Obtaining a License</i> on page 5.	
Getting Started CD	<i>Customer Service Reference Guide</i> , <i>SyBooks™ Installation Guide</i> , PowerBuilder and InfoMaker® Release Bulletins, order card for printed documentation, and this Installation Guide.
PowerBuilder DVD	Common setup program for PowerBuilder 12.0 (PowerBuilder .NET and PowerBuilder Classic), InfoMaker 12.0, and SQL Anywhere® 11.0.1, and a support folder that contains files that can be used to rebuild the PowerBuilder extensions for Web services clients and other supporting files.
PowerBuilder SyBooks CD	Documentation for PowerBuilder in HTML-based and PDF formats.

## System Requirements

Make sure your system meets all requirements before you install PowerBuilder. See the release bulletin for the most current information about required service packs.

**Table 2. System Requirements for PowerBuilder**

Product	Computer	Minimum memory	Hard disk space	Operating system
<p>This table provides system requirements for each product in PowerBuilder. All products require a DVD-ROM drive. The disk space requirements provided are approximate. The actual disk space you need for each product might vary depending on hard disk size, partitioning, and the features you choose to install. Additional temporary space is required on the hard disk during installation for uncompressing install files.</p>				
Power-Builder	Pentium 4 or higher	512MB	656MB for all components	Windows XP Professional with SP 3, Windows XP Tablet PC Edition with SP 3, Windows Vista 32/64 bit Business with SP2, Windows 7 32-bit, or Windows Server 2008 with SP2 <sup>1</sup> .
InfoMaker	Pentium 4 or higher	256MB	332MB for all components <sup>2</sup>	Windows XP Professional with SP 3, Windows XP Tablet PC Edition with SP 3, Windows Vista 32/64 bit Business with SP2, Windows 7 32-bit, or Windows Server 2008 <sup>1</sup> .
SQL Anywhere	400 MHz or higher Pentium-compatible	48MB in addition to memory required by the operating system	337MB for all components not including Ultra-Lite and Windows Mobile	Windows 2000, Windows XP, Windows XP Tablet PC Edition, Windows Server 2003, and Windows Vista, Windows 7, and Windows Server 2008 (x86, x64, IA64) <sup>1</sup> .

<sup>1</sup> Supports Windows Server 2008 runtime only, not development.

<sup>2</sup> Less disk space is required if PowerBuilder is installed on the same computer.

## Obtaining a License

---

Before installing your product, choose a SySAM license model, gather information about the license server, and obtain license files.

These steps summarize how to install a Sybase® Software Asset Management (SySAM) license. For details, see the *Sybase Software Asset Management Users Guide* on the SyBooks online bookshelf or on the Sybase Product Manuals Web site at <http://sybooks.sybase.com>.

1. Choose a SySAM license model.

License model	Description
<b>Unserviced license model</b>	Licenses are obtained directly from a license file. If you are using an unserved license, save the license file to the machine on which you install the product.
<b>Served license model</b>	A license server manages the allocation of licenses among multiple machines.

2. For the served license model, decide whether to use an existing or new license server.

The license server and your product installation do not need to share the same machine, operating system, or architecture.

3. For the served license model, determine the type of server system:

- Install the new license server on a machine that does not have an existing license server.
- To install on a machine that is running a SySAM 1.0 license server, follow migration instructions in the *Sybase Software Asset Management User's Guide* to migrate to the newer SySAM version.

4. Before installing your product, get license files from the Sybase Product Download Center (SPDC) at <https://sybase.subscribenet.com> using SPDC access information you receive from Sybase or your Sybase reseller.

## SySAM Troubleshooting

This topic describes possible problems with SySAM licenses.

Read this topic if you experience problems with SySAM licensing. The information might help you resolve the issues, or to collect information that Technical Support can use to diagnose them. You can find more information about SySAM licensing on the SySAM Web site at <http://www.sybase.com/sysam> and in the SySAM Infocenter at <http://infocenter.sybase.com/help/topic/com.sybase.infocenter.help.sysam/title.htm>.

### Logging SySAM information

To enable logging, add an entry to the `PB.INI` file with the following format:

## Planning Your Installation

```
[pb]  
LogSySAM = N
```

*N* can be any of these values:

- **0** – No logging (default)
- **1** – Basic logging information
- **2** – Full information

The SySAM log file, `PB120_sysam.log`, contains status information from the development environment, the details of the current license, and information from the SySAM API, if you set the `SySAMTrace` value in `PB.INI`. Technical Support might ask you to set these values if you experience license problems.

The SySAM log file is saved in the same directory as other writeable files for individual users, such as initialization files. See *What the Setup Program Does* on page 25 for the location of this directory on various Windows systems.

Two additional files, `pb120_sysam.properties` and `PB120.lic`, are installed in the directory for individual users. These files contain information that might be useful to Technical Support. Do not edit these files unless directed to do so by Technical Support.

### Served license issue

If you enter an unqualified server name, such as `myserver`, as the license server name, the server name might not be found. Try a fully qualified name, such as `myserver.mydomain.com`.

## Software Requirements

---

Identify the software requirements for PowerBuilder.

**Table 3. Required Software for PowerBuilder features**

Feature	Required Software
<p>The following table lists the software required for PowerBuilder features.</p> <p>Install any required framework packages and SDKs before you install PowerBuilder. Microsoft developer software is available from the <i>Microsoft Download Center</i>.</p> <p>Read this table carefully to determine whether you need to install any software before you run the setup program, and whether you need to install SQL Anywhere before installing PowerBuilder. If you select a feature with a prerequisite that is not yet installed, the setup program displays a warning message.</p>	

Feature	Required Software
.NET target development and deployment	<p>Microsoft .NET Framework Version 3.5 Service Pack 1, Visual Studio 2008 SP1 and hotfixes.</p> <p>This required software can be automatically installed for you during PowerBuilder installation. See <i>Starting the Common Setup Program</i> on page 13.</p>
.NET Windows Forms smart client deployment and update and support for OLE controls in Windows Forms	<p>Microsoft .NET Framework Version 2.0 or later.</p> <p>For design time only, Microsoft .NET Framework 2.0 Software Development Toolkit (SDK).</p>
WCF Client and Web Service DataWindow in PowerBuilder .NET	<p>Microsoft .NET Framework Version 2.0 or later.</p> <p>For design time only, Microsoft Windows SDK for Windows Server 2008 and .NET Framework 3.5, referred to elsewhere in this document as <i>.NET Framework 3.5 SDK</i>.</p>
WPF smart client development and update	<p>Microsoft .NET Framework Version 2.0 or later.</p> <p>For design time only, .NET Framework 3.5 SDK.</p>
PowerBuilder Classic Web Forms	<p>AJAX 1.0 on both design time and runtime computers. Available for download at <a href="http://www.microsoft.com/downloads/details.aspx?FamilyID=ca9d90fa-e8c9-42e3-aa19-08e2c027f5d6">http://www.microsoft.com/downloads/details.aspx?FamilyID=ca9d90fa-e8c9-42e3-aa19-08e2c027f5d6</a>.</p>
.NET Web Forms development and deployment and .NET Web services local host deployment	<p>Microsoft Internet Information Services (IIS) 5.0 or higher.</p> <hr/> <p><b>Note:</b> On the development computer, IIS is not required for PowerBuilder applications or components unless the same computer is used a server for Web Forms or smart client applications, or for Web service components. IIS is also not required on end users' computers.</p> <hr/> <p>For information about configuring IIS, see <i>Deploying Applications and Components to .NET</i> in the help.</p>
.NET Web Forms development and deployment	<p>AJAX extensions.</p> <p>You can download and install the Microsoft ASP.NET AJAX Extensions version 1.0 from the ASP.NET Web site at <a href="http://www.microsoft.com/downloads/details.aspx?FamilyID=ca9d90fa-e8c9-42e3-aa19-08e2c027f5d6&amp;displaylang=en">http://www.microsoft.com/downloads/details.aspx?FamilyID=ca9d90fa-e8c9-42e3-aa19-08e2c027f5d6&amp;displaylang=en</a>.</p>
.NET Web Forms development and deployment	<p>Telerik RadControls.</p> <p>.NET Web Forms use RadControls to display and provide functionality for the Tab, TreeView, and Toolbar controls. If you choose to install the .NET Web Forms feature, this software is installed automatically. RadControls are automatically deployed with your Web Forms applications to deployment computers or servers.</p>

Feature	Required Software
PowerBuilder and InfoMaker tutorials, demo databases, and sample applications	<p>SQL Anywhere 11.0.1 or later.</p> <p>SQL Anywhere is available on the DVD. If the setup program does not detect SQL Anywhere 11.0.1 or later on your computer, you receive a warning if you select or InfoMaker.</p> <p>If you choose to continue, the setup program does not install the tutorials or register the demo databases. To use these features later, install SQL Anywhere first, then reinstall PowerBuilder, InfoMaker, or both.</p>
MobiLink™ synchronization	<p>Adaptive Server® Anywhere 9.0.2 or SQL Anywhere 11.0.1 or later.</p> <p>MobiLink is a component of Adaptive Server Anywhere and SQL Anywhere. In the SQL Anywhere setup program, select Synchronization and Messaging, and then MobiLink.</p>
EAServer component and Web DataWindow development and deployment	<p>EAServer 5.5 with EBFs 13993 and 14146, EAServer 6.3, or later.</p> <p>Run the setup program in the PBVM directory on the DVD to install runtime files and the Web DataWindow server component in EAServer. See <i>Silent Install and Uninstall for the PBVM</i> on page 32.</p>
EJB client development	<p>EAServer 5.5 with EBFs 13993 and 14146, EAServer 6.3, or another J2EE-compliant application server such as BEA WebLogic 8.1 and later, or IBM WebSphere 6.x. Sun JDK 1.6 or later.</p> <p>The Sun JDK 1.6 is installed in the Sybase\Shared\PowerBuilder\jdk1.6.0_02 directory when you install PowerBuilder.</p>
Web service clients and Web Service DataWindow in PowerBuilder Classic	<p>Microsoft .NET Framework Version 2.0 or later.</p> <p>For design time only, Microsoft .NET Framework 2.0 SDK.</p>
Saving DataWindows as PDF using the Ghostscript distiller and PostScript printing	<p>Ghostscript and PostScript printer driver.</p> <p>See <i>Installing Ghostscript</i> on page 34 and <i>Installing PostScript Drivers</i> on page 35.</p>
Saving DataWindows as PDF using XSL Formatting Objects (FO) and Java printing	<p>Sun JDK 1.3 or later and Apache FO processor.</p> <p>The Sun JDK 1.6 is installed in the Sybase\Shared\PowerBuilder\jdk1.6.0_02 directory when you install PowerBuilder.</p> <p>The Apache FO processor is installed in the Sybase\Shared\PowerBuilder\fo-0.20.4 directory when you install PowerBuilder.</p>
PowerDesigner® plugin	<p>PowerDesigner 15.2.</p> <p>An evaluation version is available on the PowerDesigner page of the Sybase Web site.</p>

Feature	Required Software
Data access using the ADO.NET interface	Microsoft .NET Framework Version 2.0 Redistributable Package or later.
JDBC connectivity	<p>Sun JDK 1.3 or later.</p> <p>Sun JDK 1.6 is installed in the Sybase\Shared\PowerBuilder\jdk1.6.0_02 directory when you install PowerBuilder.</p>
Runtime Packager	<p>Microsoft Windows Installer.</p> <p>Microsoft Windows Installer is installed by default on all supported Windows platforms.</p>

# Preinstallation Tasks

This topic describes tasks to perform before installation.

- Read the release bulletins for the latest information on the products that you are installing. Pay close attention to the *Special Installation Instructions* section. Release bulletins for PowerBuilder and InfoMaker are available in the product package on the Getting Started CD. Release bulletins for PowerBuilder and InfoMaker are also available on the Product Manuals Web site at <http://www.sybase.com/support/manuals/>. The release bulletins at this site sometimes contain more recent information than the bulletins on the Getting Started CD. A `readme.txt` file for SQL Anywhere is available in the `SQLAnywhere11` directory on the DVD.
- Make sure the drive on which you install PowerBuilder is not compressed. If compression is enabled on the installation drive, the setup program fails.
- Make sure you have a `TEMP` environment variable that points to an existing directory location with at least 300MB free space. The setup programs write files to this directory during the installation and frees the space after the installation is complete.
- Close any open applications.
- Back up any files created with earlier versions of Sybase tools. Make sure that any PowerBuilder PBLs you plan to migrate have been regenerated without error in your current version of PowerBuilder before you back them up.

In addition to backing up your PBLs, back up any files that contain information you do not want to lose, such as database files, INI files, preference information, and modified database definition files. For more information about backing up and migrating existing applications, see *Postinstallation Tasks* on page 33.

- Read *Software Requirements* on page 6 to determine whether you need to install any software before installing PowerBuilder 12.

# Starting the Common Setup Program

Use the DVD or downloaded image to start the PowerBuilder setup program.

The PowerBuilder setup program installs both the PowerBuilder Classic and PowerBuilder .NET IDEs.

This procedure describes how to begin a local installation from a DVD or downloaded image. If you are a system administrator and want to allow users to install from a network drive instead, copy the files from the DVD into a directory on a network drive. Users can then install PowerBuilder by running the setup program from the network.

1. Exit any programs that are running.
2. Launch the PowerBuilder setup program.
  - To install from an image that you have downloaded from the Sybase Web site, run the `autorun.exe` file.

---

**Note:** If you run `setup.exe`, the setup program does not enable you to install the SQL Anywhere program.

---

- To install from the PowerBuilder DVD, insert the disk into your DVD-ROM drive. The setup program starts automatically.
  - To install from a local network drive, follow your administrator's instructions for accessing and running the setup program there.
3. In the 12.0 DVD window, click **Install PowerBuilder .NET Prerequisites**.

This installs .NET Framework 3.5 SP1 and the Visual Studio Isolated Shell 2008 SP1.

Do not skip this step unless you are sure that the prerequisite software is already installed on your system.

4. Click **Install Powerbuilder 12.0** to start the common setup program.

The setup program collects basic and licensing information before launching the individual setup programs for PowerBuilder, InfoMaker, and SQL Anywhere.

## Starting the Common Setup Program

# Providing Basic Information

The common setup wizard collects basic information before beginning the PowerBuilder and InfoMaker installations.

---

**Tip:** Click **Cancel** to interrupt the installation at any point during this procedure. You can then either exit or resume the common setup. If you choose to exit, you can stop the current installation and continue with your other selections, or end the setup completely.

---

To provide basic information before installing PowerBuilder and InfoMaker:

1. On the start page of the setup program, select **PowerBuilder 12.0**.

2. On the Welcome page, click **Next**.

If you have not installed prerequisites for the current feature, the next page in the wizard informs you what needs to be installed. Click **Cancel** to exit the wizard, or **Next** to continue without installing the prerequisites.

3. On the License Type page, select one of these license types and click **Next**:

- Evaluation

The Evaluation license allows you to install PowerBuilder for 30 days, for evaluation purposes only.

Go to Step 5 on page 16 to complete the License Agreement page and continue this procedure from that point.

- Standalone Seat - Local License
- Standalone Seat - Served

In the Server Information page, enter the name of the license server provided by your system administrator. If the administrator who installed the license server defined a non-default TCP port number, you might also need to provide the TCP port number. Click **Next** and wait for a few seconds until the setup program validates the license.

---

**Proceeding Without a Valid License:** You can select the local license or served license option without loading a license file or specifying a server location. When you click **Next**, the setup program displays an error message box. After you close the error message, the setup prompts you to confirm that you will obtain a valid license key within 30 days. Click **Yes** to proceed with the installation. Note that the installed products stop functioning after 30 days unless you install a valid license file or license server first.

---

4. In the License Key page:

- a) Click **Load**.
- b) Navigate to and select your license file, and click **Open**.
- c) Click **Next**. Wait for a few seconds until the setup program validates the license.

## Providing Basic Information

5. On the License Agreement page, select your location from the drop-down list, read the license agreement, select the **I AGREE** radio button, and click **Next** to continue.
6. On the Customer Information page, enter your name and your company's name.
7. On the Choose Destination Location page, click **Next** to accept the destination path shown, or click **Browse** and select a different path, click **OK**, and click **Next**.
8. On the Choose Destination Location For Shared Files page, click **Next** to accept the destination path shown, or click **Browse** and select a different path, click **OK**, and click **Next**. Use the same folder for shared files for all products in this set.
9. On the Select Components page, select the products you want to install and click **Next** to continue.
10. Complete the setup program for each product you selected.

# Installing SQL Anywhere

Install SQL Anywhere to support database features during application development.

You can start the SQL Anywhere installation using either of these methods:

- The common setup program, described in this topic.
  - The **silentinstall** command-line program.
1. In the Choose Setup Language dialog box, select the language you want to use in the Installation wizard and click **OK**.
  2. On the Welcome page, click **Next**.
  3. On the License Agreement page, select your location from the drop-down list, read the license agreement, select the **I accept the terms of this agreement** option, and click **Next** to continue.
  4. On the Setup Type page, select **Complete** if you want to install all components, or select **Custom** and click **Next**.
  5. If you selected **Custom** in the previous step, click the down arrow next to any feature you do not want to install, select **This feature will not be available** from the cascading menu, and click **Next**.
  6. On the Ready to Install the Program page, click **Install** to begin the installation.
  7. Optionally select the check boxes in the InstallShield Wizard Completed page to view the ReadMe file or the iAnywhere Online Resources page.
  8. Click **Finish** to close the SQL Anywhere installation wizard.

---

**Note:** Sometimes, a dialog opens with this erroneous message:

Invalid license data. Reinstall is required.

Click **OK** to dismiss the dialog; the SQL Anywhere installation completes normally.

---

## About SQL Anywhere

---

Sybase SQL Anywhere is a fully-featured relational database and data management tool.

The SQL Anywhere installation is restricted to development use only. Deployed systems require a separate SQL Anywhere license or the SQL Anywhere Runtime Edition, described in the next section. The SQL Anywhere installation includes MobiLink, a session-based synchronization system that allows two-way synchronization between a main database and many remote databases, and the Sybase Central database management tool.

### **SQL Anywhere Runtime Edition**

PowerBuilder also includes the SQL Anywhere for Windows royalty-free runtime edition (the *SQL Anywhere Runtime Edition*). The SQL Anywhere Runtime Edition is a restricted-functionality version of the standalone version of SQL Anywhere. For example, the SQL Anywhere Runtime Edition does not support stored procedures and triggers, transaction logs, or synchronization.

The SQL Anywhere setup program included on the PowerBuilder installation DVD installs the SQL Anywhere Runtime Edition by default. For more information, including the list of Redistributable Components of the SQL Anywhere Runtime Edition, see the `RuntimeEdition.html` file in the main SQL Anywhere 11 directory.

The SQL Anywhere setup program installs the SQL Anywhere developer edition in default drives and directories unless you specify otherwise. If a directory you specify does not exist, the setup program creates it.

# Installing InfoMaker

This topic describes how to install InfoMaker, an easy-to-use tool for creating applications that query and report on databases.

The common setup program installs InfoMaker in default drives and directories unless you specify otherwise. If a directory you specify does not exist, setup creates it.

1. On the Choose Destination Location page, click **Next** to accept the destination folder path shown, or click **Browse** and select a different path, click **OK**, then click **Next**.
2. On the Choose Destination Location For Shared Files page, click **Next** to accept the destination folder path shown, or browse to select the `Sybase\Shared` directory.
3. On the Select Components page, unselect the check box next to any components you do not want to install, and click **Next**.

You can expand the tree view to select or unselect subcomponents of top-level components, and click **Select All** or **Unselect All** to select or unselect all the check boxes.

You cannot unselect the **InfoMaker Base Components** option. See *InfoMaker Components* on page 20. To install optional painters, select the **Database Write** option.

The Demo Database is selected by default if you select the **Tutorial** component.

4. On the Select Program Folder page, select the program folder to which program icons will be added or specify a new one, and click **Next**.
5. On the Start Copying Files page, review your settings, then click **Next** to begin installing files or **Back** to change your selections.
6. On the InstallShield Wizard Complete page, select the check box if you want to read the Readme file, and click **Finish** to return to the common setup program.

Close the Readme file to continue.

## InfoMaker Components

---

The setup program lets you install the base InfoMaker software and additional, optional components.

**Table 4. InfoMaker Components**

Component	Description
InfoMaker Base Components	The base components are required. If you select no other other components, this option installs InfoMaker as a reporting and query tool only. No optional painters are installed. You cannot open forms in the InfoMaker tutorial library; those forms require use of the optional painters that are installed with the database write option. This option installs the ODBC driver.
InfoMaker Database Write Option	Adds three additional painters so that you can work with data more fully: <ul style="list-style-type: none"> <li>• Database painter for creating and modifying tables</li> <li>• Form painter for creating and modifying data in a database</li> <li>• Data Pipeline painter for copying data from one database to another</li> </ul>
Native Database Interfaces	Interfaces that enable you to interact with server databases natively. Expand the tree view to select which interfaces to install.
OLE DB Driver	Interface to connect to databases using an OLE DB data provider.
JDBC Driver	Interface to connect to databases using JDBC.
Internet Tools	The DataWindow Web Control for ActiveX is a fully interactive DataWindow control. It requires a browser that supports ActiveX.
InfoMaker Tutorial	Source files for the tutorial in the Getting Started book. If you want to do the InfoMaker tutorial or use the sample library, install SQL Anywhere 11.0.1 or later if it is not already installed on your computer. When you install InfoMaker, the setup program creates an ODBC data source for the demo database. If SQL Anywhere is not installed on your system when you install InfoMaker, setup does not install the demo database, sample library, or tutorial files.
Demo Database	A SQL Anywhere database used in the tutorial, the sample library, and examples in the documentation.
Online Help Files	The imhlp20.hlp and imman20.chm compiled HTML Help files.

# Installing PowerBuilder

Run the PowerBuilder setup program to install PowerBuilder .NET and PowerBuilder Classic.

## Prerequisites

You must have Administrator privileges to fully install this product.

## Task

1. On the Choose Destination Location page, click **Next** to accept the destination folder path shown, or click **Browse** and select a different path, click **OK**, then click **Next**.
2. On the Choose Destination Location For Shared Files page, click **Next** to accept the destination folder path shown, or browse to select the Sybase\Shared directory.
3. On the Select Components page, unselect any components you do not want to install, and click **Next**.

You cannot unselect the **PowerBuilder Base Components** option.

Select or select the check boxes of individual components, or click **Select All** or **Unselect All** to change all the check boxes.

The Demo Database is selected by default if you select the **Tutorial** component.

4. On the Select Program Folder page, select the program folder to which program icons will be added, or specify a new one; then click **Next**.
5. On the Start Copying Files page, review your settings, then click **Next** to begin installing files, or **Back** to change your selections.
6. On the InstallShield Wizard Complete page, select the check box if you want to read the Readme file, then click **Finish** to return to the common setup program.

## Next

After installing, make sure users have write permission for their user profile directories (for example, My Documents in Windows XP and Documents in Windows Vista), and for HKEY\_CURRENT\_USER in the Windows registry.

## PowerBuilder Components

---

The setup program lets you choose which PowerBuilder components to install.

**Table 5. Components**

Component	Description
PowerBuilder Base Components	Installs the ODBC driver, ORCA Software Development Kit (SDK), the PowerBuilder Document Object Model extension, the ability to save DataWindow objects as PDF using the distill or XSL-FO methods, support for rich text, support for EAServer, and JDK 1.6. You must install the base components: you cannot unselect this option.
.NET Targets	Available under PowerBuilder Base Components, deploys Windows Forms, smart client, and Web Forms applications to .NET, and deploys NVOs as .NET assemblies and Web services.
PowerBuilder .NET	The PowerBuilder .NET IDE hosts the Visual Studio isolated shell and is designed for full compliance with the common language specifications for .NET. Used for deploying Windows Forms, smart client, and Web Forms applications to .NET and deploying NVOs as .NET assemblies and Web services.
Native Database Interfaces	Interfaces that enable you to interact with server databases natively. Expand the tree view to select interfaces to install.
ADO.NET Driver	Interface to connect to databases using an ADO.NET data provider.
OLE DB Driver	Interface to connect to databases using an OLE DB data provider.
JDBC Driver	Interface to connect to databases using JDBC.
SCC Interface	Interface for connecting to any source code control system that supports the Microsoft SCC interface.
DataWindow Web Control for ActiveX	The DataWindow Web Control for ActiveX is a fully interactive DataWindow control. It requires a browser that supports ActiveX.
PB Native Interface	An SDK for developing extensions to PowerBuilder in C++. Optional wizards are installed in Visual Studio 2005 and Visual Studio .NET 2002 and 2003 if they are available on your system.
EJB Client	The EJB Client PBNI extension, which enables you to develop clients for EJBs running on J2EE-compliant servers.
Web Services	The extensions and other files that enable you to create clients for Web services using the .NET or EasySoap Web service engines.
PowerDesigner Plug-in	A plug-in that provides the class diagram functionality of the OOM inside the PowerBuilder development environment.

Component	Description
Tutorial	Source files for the tutorial in the <i>Getting Started</i> book. If you want to do the PowerBuilder tutorial or use the code examples, install SQL Anywhere 11.0.1 or later if it is not already installed on your computer. When you install PowerBuilder, the setup program creates an ODBC data source for the demo database. If SQL Anywhere is not installed on your system when you install PowerBuilder, setup does not install the demo database, code examples, or tutorial files.
Demo Database	A SQL Anywhere database used in the tutorial, the Code Examples sample application, and examples in the documentation.
Code Examples	The Code Examples application, which demonstrates many coding techniques, and the Web DataWindow PBL, which can be used as a model for a custom Web DataWindow server component.
Translation Toolkit	Tools to help you translate applications into other languages.
PowerBuilder Resource Monitor	A utility to help determine whether there are sufficient USER/GDI resources available in the operating system to open a painter.
PowerBuilder Runtime Packager	A tool that packages files required for deployment into an MSI file.
Online Help Files	The <code>pbhlp120.hlp</code> Windows Help file, the <i>Getting Started</i> book in PDF format, and the <code>pbman120.chm</code> compiled HTML Help file. Several *.HxS Help 2 files are used in the PowerBuilder .NET IDE.

# Completing the Setup Program

After all the products you selected have been installed, you return to the common setup program.

To complete the common setup program:

1. On the InstallShield Wizard Complete page, click **Finish** to complete the installation. If you do not unselect the check boxes on this page, setup displays the readme file and launches a browser so that you can complete online registration.
2. On the System Reboot Required page, click **Finish** to reboot your computer, or choose to reboot your computer later.

After installing any of the PowerBuilder products, always shut down and restart your computer before using it.

## What the Setup Program Does

---

This topic describes changes that the setup program makes to your system.

The setup program:

- Installs Sybase files in a Sybase directory
- Installs writable Sybase files to directories that are shared by all users
- Installs system files in the Windows operating system path
- Creates a program group and icons for each product installed
- Creates uninstall files to identify what needs to be removed if you uninstall a product
- Makes changes to the Windows registry
- Creates or updates INI files including PB.INI (for PowerBuilder) and IM.INI (for InfoMaker)

### Writable files shared by all users

As part of its Federal Desktop Core Configuration (FDCC) compliance configuration, PowerBuilder installs writable files that are shared by all users. On Windows XP and Windows 2003, the shared directory is `C:\Documents and Settings\All Users\Documents\Sybase\PowerBuilder 12.0`. On Windows Vista and Windows 2008, the shared directory is `C:\Users\Public\Documents\Sybase\PowerBuilder 12.0`, and on Windows 7, it is `C:\Users\Public\Public Documents\Sybase\PowerBuilder 12.0`.

The shared files include:

## Completing the Setup Program

- The EASDemo databases (easdemo120.db and easdemo120u.db)
- All Code Examples directories and files
- The PowerBuilder Windows Help and compiled HTML Help files
- The Translation Toolkit directories and files

### Files reserved for individual users

Other writable files are installed in the default `Program Files\Sybase` subdirectories, but are copied to different locations the first time a user starts PowerBuilder. In this way, each user gets a private copy of these files.

The following table lists the files that are copied and updated in the directories of users. In the table header, *UserName* is a variable that can be replaced by the user name of a PowerBuilder user. For Windows XP and 2003, the *UserName* directory is under the `C:\Documents and Settings` directory. For Windows Vista and 2008, it is under the `C:\Users` directory.

In <code>C:\...\UserName\ subdirectory</code>	Files copied or updated
On Windows XP and 2003:  Local Settings\Application Data\Sybase\PowerBuilder 12.0	<ul style="list-style-type: none"><li>• Initialization files (PB.INI, PBLAB120.INI, PBODB120.INI)</li></ul>
On Windows Vista, Windows 2008, and Windows 7:  AppData\Local\Sybase\PowerBuilder 12.0	<ul style="list-style-type: none"><li>• License files (PB115.LIC, pb120_sy-sam.properties)</li></ul>
On Windows XP and 2003:  My Documents\Sybase\PowerBuilder 12.0\Tutorial	<ul style="list-style-type: none"><li>• Files for the PowerBuilder Getting Started tutorial</li></ul>
On Windows Vista and 2008:  Documents\Sybase\PowerBuilder 12.0\Tutorial	
On Windows 7:  My Documents\Sybase\PowerBuilder 12.0\Tutorial	

The locations of writable PowerBuilder files reserved for individual use are set in HKEY\_CURRENT\_USER registry entries for each PowerBuilder user. For example, the location of the PB.INI file that is copied to each user's local application data directory is

registered under the registry key `HKEY_CURRENT_USER\Sybase\PowerBuilder\12.0\InitPath`

### **Registry changes**

The setup program makes the following changes to the Windows registry:

- Creates a root registry key at `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\AppEnv\9.0\Apps\pbshell_6082CEF1-0148-4a14-BD24-57A47D547729`
- During execution, dynamic information is rooted at `HKEY_CURRENT_USER\Software\Microsoft\AppEnv\9.0\Apps\pbshell_6082CEF1-0148-4a14-BD24-57A47D547729`
- Creates or updates the Sybase key in `HKEY_CURRENT_USER\Software` and `HKEY_LOCAL_MACHINE\Software`
- Updates system and user paths in `HKEY_CURRENT_USER\Environment`
- Adds the appropriate paths to the registry path `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\App Paths`
- Adds the paths of compiled HTMLHelp files to the registry path `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\HTMLHelp`

## Completing the Setup Program

# Installing in Silent (Unattended) Mode

Install or uninstall PowerBuilder products from a Command Prompt window or script, without displaying messages or windows during the setup or removal process.

## Prerequisites

Complete installation planning.

## Task

1. Accept the license agreement.
2. Locate the `silentinstall.bat` file, either in the main installation directory on the DVD, or in the PBVM directory.
3. Run **silentinstall.bat** to install one or all of these PowerBuilder products:
  - PowerBuilder
  - InfoMaker
  - SQL Anywhere
  - PBVM

## Accepting the License Agreement

---

Accept the Sybase license agreement before running the silent installation.

You can accept the Sybase license agreement first using either of these methods:

- Enter the following line in a DOS command box:

```
SET AgreeToSybaseLicense=true
```

If the DOS prompt does not display the installation directory, change to that directory.
  - Use the main installation directory to install PowerBuilder and InfoMaker
  - Use the PBVM directory to install the virtual machine
- Edit the `silentinstall.bat` file and change the value of `set AgreeToSybaseLicense` from `false` to `true`. This configuration enables you to double-click the `silentinstall.bat` file instead of running it from a Command Prompt window.

## Silent Install and Uninstall for PowerBuilder Products

This topic describes the `silentinstall` and `silentuninstall` command syntax for PowerBuilder, InfoMaker, and SQL Anywhere.

To run the silent installation from a Windows Command Prompt, run this command in the install directory:

```
silentinstall.bat
[ " lic = licPathNameOrServerName " " opt = product " " dir = directoryName " "
shr = sharedDirectoryName " " log = logFileName " ]
[ { help | /? } ]
```

All of the parameters for the silent installation are optional. If you do not provide a value for the `lic` parameter, the installer searches the files in the installer directory in ascending alphabetic order for a valid license file. It uses the first valid license file it finds to install PowerBuilder and InfoMaker. If you do not provide the `lic` parameter and there is no license file in the installer search path, an evaluation version of PowerBuilder is installed.

The parameters can be listed in any order and are not case sensitive. Parameter values are also not case sensitive.

Silent installation parameter	Description
<i>licPathNameOrServerName</i>	The full path to a valid license file with an LIC extension, or the name of a server hosting a served license. If a license server requires a port number, you can include the port number after the server name, separated by a colon. For example:  <code>silentinstall.bat "lic=myServer:1688"</code>
<i>product</i>	Names the product or products to install. Values are: <ul style="list-style-type: none"> <li>• <b>All</b> – Installs PowerBuilder, InfoMaker, and SQL Anywhere (default)</li> <li>• <b>PB</b> – Installs only PowerBuilder</li> <li>• <b>IM</b> – Installs only InfoMaker</li> <li>• <b>SA</b> – Installs only SQL Anywhere</li> </ul>

Silent installation parameter	Description
<i>directoryName</i>	Indicates the main installation directory. If you omit this parameter, the main product components install to the <i>sysDriver</i> \Program Files\Sybase\ <i>productName</i> directory, where <i>sysDriver</i> is the main computer drive, and <i>productName</i> is either PowerBuilder 12.0 or InfoMaker 12.0.
<i>sharedDirectoryName</i>	Indicates the shared directory for PowerBuilder or InfoMaker. If you omit this parameter, this directory installs to <i>sysDriver</i> \Program Files\Sybase\Shared.
<i>logFileName</i>	Names the log file for the installation. If you omit this parameter, the log file is written to the system Temp directory with the file name, <code>silentinstall.log</code> .
help or <code>/?</code>	Displays command syntax and parameters instead of running the command.

The following example uses all five parameters for the silent installation command:

```
silentinstall.bat "lic=D:\pb120\pb120.lic" "opt=pb" "dir=D:\pb120" "shr=D:\shared" "log=D:\install.log"
```

When installing PowerBuilder, the silent installation writes warnings to its log file if the setup computer does not have any of these items:

- SQL Anywhere 11.0.1
- Microsoft .NET Framework 3.5 SP1
- Microsoft .NET Framework 2.0 SDK or later
- Microsoft IIS 5.0 or later, or AJAX Extensions version 1.0

When installing InfoMaker, the log file includes a warning if the setup computer does not have a working copy of SQL Anywhere. If SQL Anywhere is not found, the demonstration databases and code examples are not installed for PowerBuilder or InfoMaker.

To start the standard silent uninstallation, run the **silentuninstall.bat** command in the main installation directory.

```
silentuninstall.bat
[ " all " ]
[ { help | /? } ]
```

By default (with no arguments), **silentuninstall** uninstalls only PowerBuilder and InfoMaker. To uninstall SQL Anywhere, specify the `all` argument.

---

**Note:** Uninstalling SQL Anywhere on 64-bit editions of Windows Vista requires elevated privileges.

---

## Silent Install and Uninstall for the PBVM

---

This topic describes the `silentinstall.bat` command syntax for the PowerBuilder VM.

If you are running the PBVM installation from the DOS command prompt, you can run the silent installation using the following syntax:

```
silentinstall.bat  
[ " asp = aspPathName " " shr = sharedDirectoryName " " log = logFileName " ]
```

You can list the parameters in any order. Parameters and their values are not case sensitive.

Silent installation parameter	Description
<i>aspPathName</i>	Names the full path where the EAServer support files are to be installed. If you omit this parameter, the default value is the EAServer folder. For example:  %SystemDrive%\Program Files\Sybase\EAServer
<i>sharedDirectoryName</i>	Indicates the shared directory for PowerBuilder or InfoMaker. If you omit this parameter, the installed directory is %SystemDrive%\Program Files\Sybase\Shared.
<i>logFileName</i>	Names the log file for the installation. If you omit this parameter, the log file is written to the system Temp directory with the file name, <code>silentinstall.log</code> .

The following example uses all three parameters to silently install the PBVM:

```
silentinstall.bat "asp=D:\EAServer" "shr=D:\shared" "log=D:\install.log"
```

To uninstall the PBVM in silent mode, run the **silentuninstall.bat** script in the PBVM directory.

## Postinstallation Tasks

Before using PowerBuilder after installation, you might need to perform some migration or configuration tasks.

- Migrating applications to the current version of PowerBuilder or InfoMaker 12.0

If you have applications and PowerBuilder library files (PBLs) that you created in an earlier version of PowerBuilder or InfoMaker, you can migrate them to version 12.0. Before you do, make sure your PBLs can be successfully regenerated under the earlier version, and make backup copies.

PowerBuilder and InfoMaker 12.0 are Unicode enabled, and some changes are made to your code when you migrate an application from PowerBuilder 9.x or earlier. For details, see the section on migrating targets in the *PowerBuilder Users Guide*.

Also read the migration issues section in the PowerBuilder release bulletin.

- Setting up your DBMS

Your DBMS might require additional setup procedures for use with PowerBuilder or InfoMaker. For details, see *Connecting to Your Database* in the *help*.

- Upgrading databases for jConnect for JDBC

Might be required to prepare SQL Anywhere or Adaptive Server® Enterprise databases for jConnect 5.5.

- Installing the PBVM in EAServer

Required if you plan to deploy PowerBuilder 12.0 components to EAServer.

- Installing Ghostscript

Required if you want to use the distill method for saving DataWindows as PDF.

- Installing PostScript drivers

Required if you want to use the distill method for saving DataWindows as PDF.

### Upgrading Databases for jConnect for JDBC

---

Prepare SQL Anywhere or Adaptive Server Enterprise databases for jConnect 5.5 by installing additional tables and stored procedures.

If you plan to use any of the products in PowerBuilder with SQL Anywhere or Adaptive Server Enterprise databases, including databases that were previously prepared for jConnect™ for JDBC™ 4.x, you need to prepare the databases for jConnect 5.5 by installing additional tables and stored procedures. Repeat the following procedure for every SQL Anywhere or Adaptive Server Enterprise database that you want to prepare for jConnect.

To prepare a SQL Anywhere or Adaptive Server database for jConnect 5.5:

1. Start Interactive SQL and connect to your database.
2. Select **File > Open** and locate the appropriate SQL file stored in the `jConnect-5_5\sp` folder.  
jConnect is installed in the `Sybase\Shared` folder. Use `sql_SA.sql` for SQL Anywhere, `sql_server12.5.sql` for Adaptive Server version 12.5 or later, `sql_server12.sql` for Adaptive Server version 12, or `sql_server.sql` for earlier versions of Adaptive Server.
3. Click **Execute**.

## Installing the PBVM in EAServer

---

This topic describes how to install the PBVM on EAServer.

Deploying PowerBuilder 12.0 components to EAServer running in a third party application server requires a set of PowerBuilder 12.0 runtime files called the PowerBuilder virtual machine (PBVM), which must be installed on the same computer as EAServer. The PBVM setup program, available in the PBVM directory on the DVD, installs the required files.

For EAServer 5.x, the PBVM setup program also installs the PowerBuilder 12.0 version of the PBDebugBroker120 component that are required for remote debugging. Although the setup program copies these components to EAServer 6.x servers, the copied components do not work properly. However, you can use the EAServer setup program to install these components with EAServer 6.3.

To install the PBVM on EAServer:

1. Run the **setup.exe** program in the PBVM directory on the PowerBuilder 12.0 DVD.
2. On the Choose Destination Location page, click **Next** if the default destination location is correct, or click **Browse** to navigate to the directory where EAServer is installed; then click **Next**.
3. On the Choose Destination Location for Shared Files page, click **Next** if the default destination location is correct, or click **Browse** to navigate to the directory you specified in Step 2 or to the `Sybase\Shared` directory; then click **Next**.

The setup program installs the PBVM in a `PowerBuilder` subdirectory of the directory you select, installs the Web DataWindow and debugger components in the `Repository` directory, and exits.

## Installing Ghostscript

---

Install Ghostscript if you plan to use the distill method for saving DataWindows as PDF.

To install Ghostscript:

1. Into a temporary directory on your computer, download the self-extracting executable file for the version of Ghostscript you want from one of the sites listed on the Ghostscript Web site at <http://ghostscript.com>.  
See the PowerBuilder release bulletin for the version of Ghostscript that was used for testing.
2. Run the executable file to install Ghostscript on your system.  
The default installation directory is C:\Program Files\gs.

## Installing PostScript Drivers

---

This topic describes how to install and use PostScript drivers for saving DataWindows as PDF.

Using the distill method for saving DataWindows as PDF requires a PostScript printer or printer driver installed on your system. Use the Windows Add Printer wizard to install a PostScript printer. If a PostScript printer was never installed on your computer or the required Microsoft `pscript5.dll` file is not available, the wizard might prompt you to insert a Windows operating system installation CD.

- To add a PostScript printer to your system:
  - a) Select **Settings > Printers** from the Windows **Start** menu.
  - b) Double-click **Add Printer**.
  - c) Specify a local printer.
  - d) Specify `FILE:` as the port.
  - e) Select a manufacturer (for example, HP) and a printer with the designation PS (such as HP LaserJet Series 4050 PS).

---

**Note:** Some printers do not handle images correctly. For example, the HP Color LaserJet PS does not display images in the PDF output, and the HP LaserJet 4/4M Plus PS 600 displays color images using greyscale.

---

- f) Accept the default name or enter a shorter name for the printer.
  - g) Complete the wizard.
- To use the print driver in the DataWindow painter:
    - a) Select the **Distill Custom PostScript** check box on the Data Export property page for PDF export.
    - b) On the Print Specifications page, specify the printer name (added to the Printer Settings dialog in Step 1.f on page 35 in the previous procedure).
  - To use the print driver in a script, set the `Distill.CustomPostScript` and `Printer` properties.

For example:

```
dw_1.Object.DataWindow.Export.PDF.Distill.CustomPostScript=1
dw_1.Object.DataWindow.Printer="HP LaserJet Series 4050 PS"
```

# Uninstalling a PowerBuilder Product

This topic describes how to uninstall PowerBuilder products.

Use one of these methods to run the PowerBuilder setup maintenance program for each product that you want to uninstall:

- Add or Remove Programs dialog box
  - a) Make a backup copy of any files you might want to reuse (such as DB, INI, and PBL files) if you plan to reinstall.
  - b) Open the Control Panel from the Start menu and double-click the **Add/Remove Programs** button.
  - c) On the Install/Uninstall tab page, select the product to uninstall, click **Add/Remove**, and click **Yes** when prompted to confirm that you want to uninstall the tool.
  - d) If you are prompted to delete a shared file, click the appropriate response.

If the usage count for a system file in the registry indicates that the file is no longer being used, the setup maintenance program asks if you want to delete the file. Some applications do not increment the usage count; therefore, *do not delete a file unless you are sure it is not being used by another application.*

- Silent uninstallation

See *Silent Install and Uninstall for PowerBuilder Products* on page 30 or *Silent Install and Uninstall for the PB VM* on page 32.

The PowerBuilder setup maintenance program removes:

- Shared and standard program files
- Folder items
- Program folders
- Program directories
- Program registry entries

The setup maintenance program deletes file and icon groups, as well as system and user path settings in the registry and INI files. Simply deleting directories does not fully uninstall these products.

---

**Removing Shared DLLs:** The setup program increments the usage count in the registry for each shared Sybase DLL and each shared system DLL. The setup maintenance program decrements that count. The setup maintenance program does not try to delete a shared DLL until the usage count reaches zero.

---

---

**Stopping the Setup Maintenance Program:** Unlike the setup program, the setup maintenance program has no **Back** or **Cancel** button. Once you click **Yes** in the procedure below, the program cannot be stopped.

---

## Obtaining Help and Additional Information

Use the Sybase Getting Started CD, SyBooks™ Online, and online help, to learn more about this product release.

- The Getting Started CD (or download) – contains release bulletins and installation guides in PDF format, and also contains other documents or updated information not included on the SyBooks CD.
- SyBooks Online at <http://sybooks.sybase.com/> – is an online version of SyBooks that you can access using a standard Web browser. You can browse documents online, or download them as PDFs. In addition to product manuals, the Web site also has links to EBFs/ Maintenance, Technical Documents, Case Management, Solved Cases, newsgroups, and other resources.
- Online help in the product, if available.

To read or print PDF documents, you need Adobe Acrobat Reader, which is available as a free download from the *Adobe* Web site.

---

**Note:** A more recent release bulletin, with critical product or document information added after the product release, may be available from SyBooks Online.
